

# Locution PrimeAlert® Configuration Portal & Manager

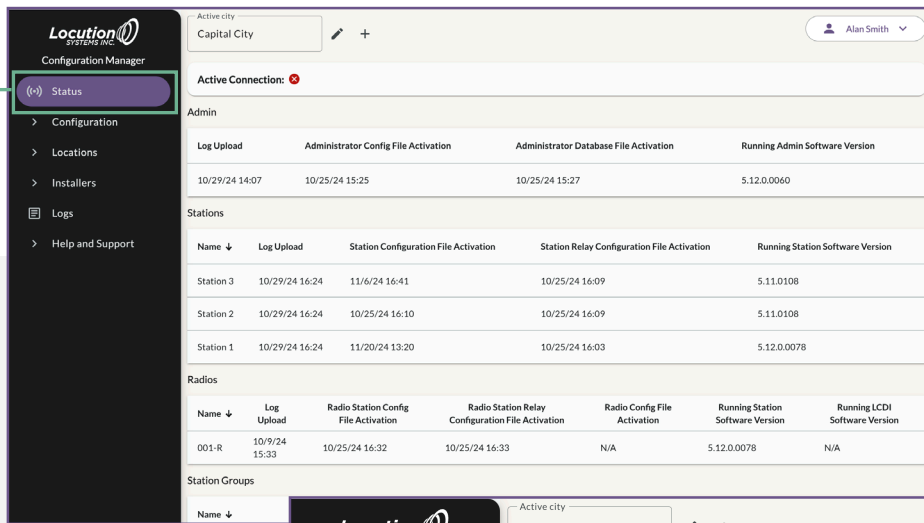

# Introduction

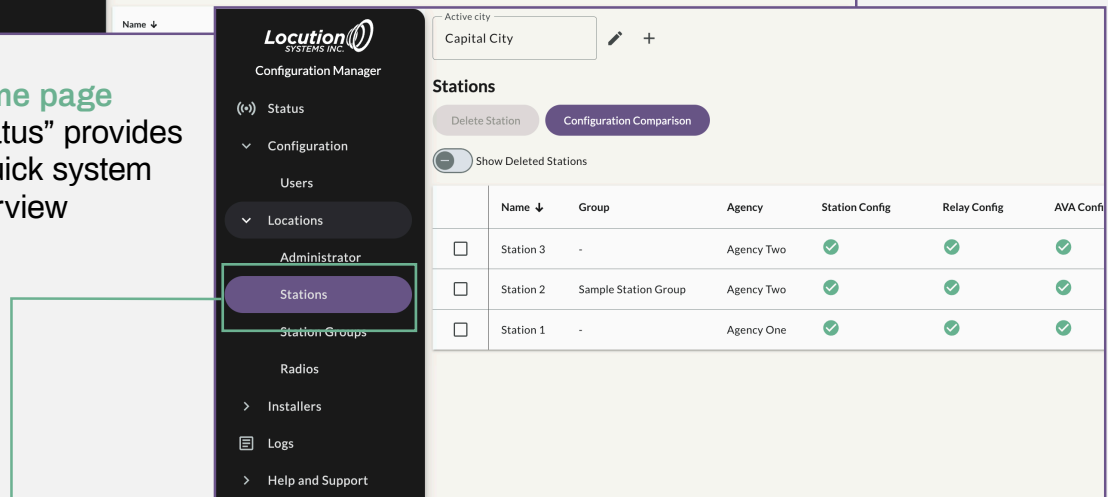

A superior **Fire Station alerting (FSA)** system must have the right software tools to monitor and manage it. Agency needs change, requiring the FSA to change. New agencies may be added to an existing Comm Center, bringing along their unique requirements.

**Locution PrimeAlert® Configuration Portal** software provides an intuitive view across the PrimeAlert® FSA solution. Administrators can view software at the file level and compare versions across stations to provide partial validation. When upgraded to **Locution PrimeAlert® Configuration Manager** software, administrators can see the element configuration settings within the files. They can also change individual settings.

## Basics of Locution PrimeAlert® Configuration Portal & Manager

Home page "Status" provides a quick system overview

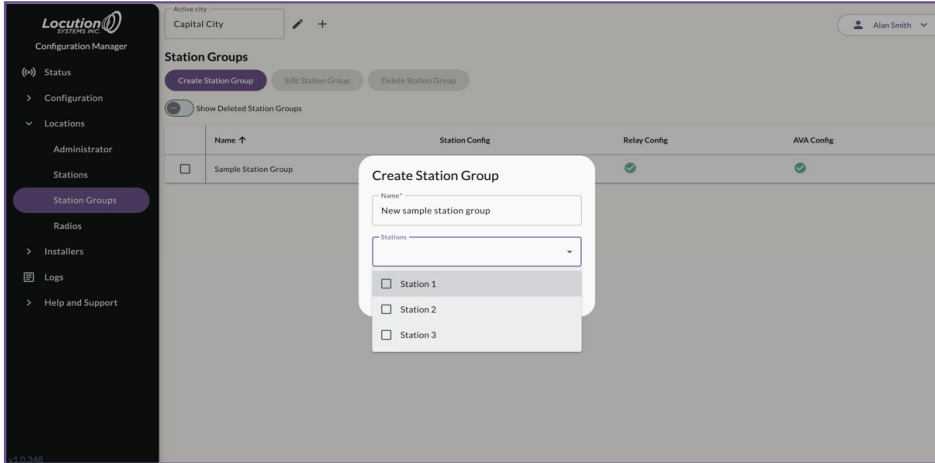

### Station Overview

- View overall status of each station

# Station Groups

The **Station Groups** menu under Locations (highlighted in purple on the left bar) allows for stations to be grouped. Click on **Create Station Group** (highlighted in purple) to enter a name for the new station group. Then click on which stations should now be part of this group.

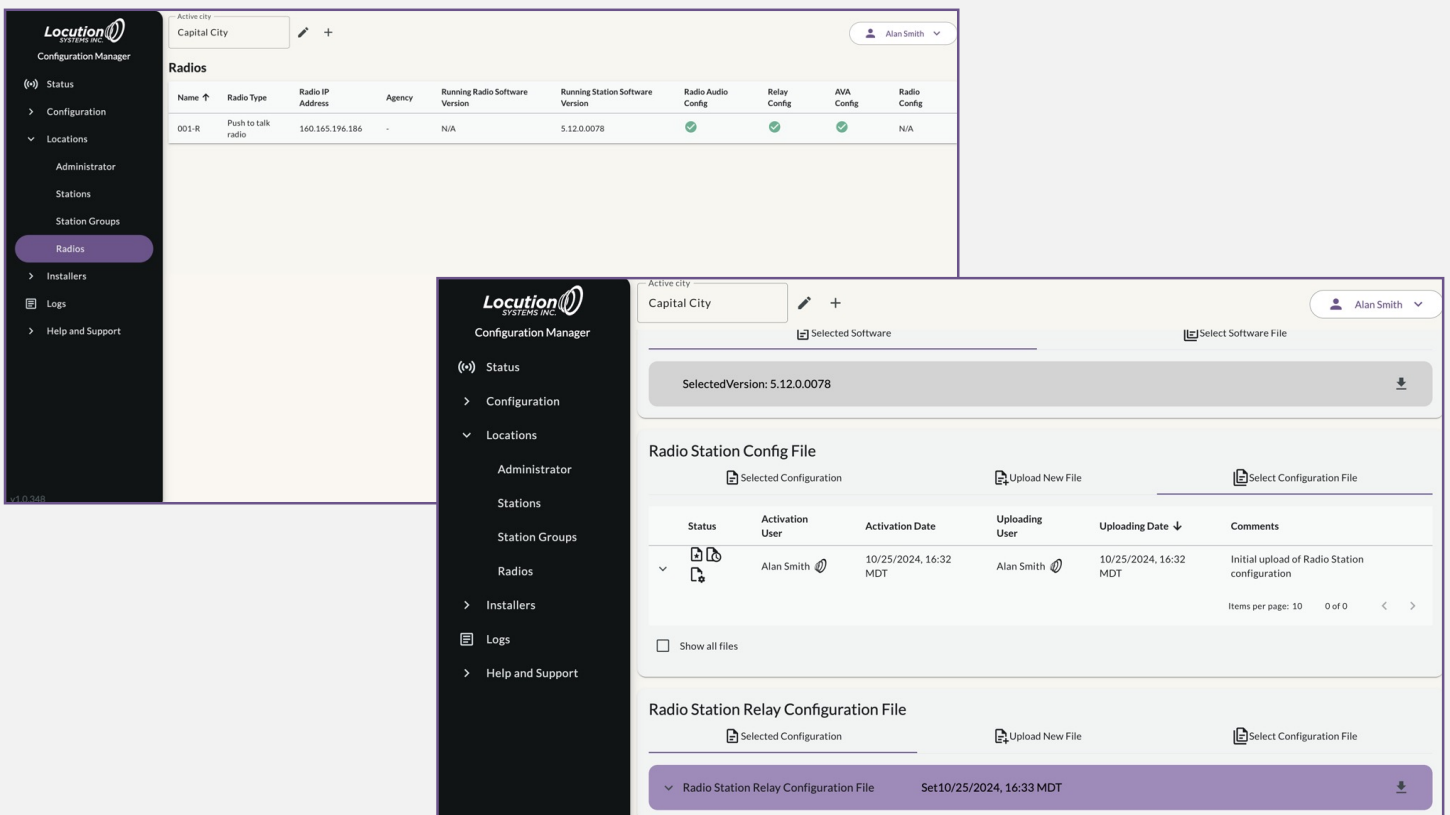

## Station Groups

- Easily create groups
- Add or remove stations from groups

# Radio

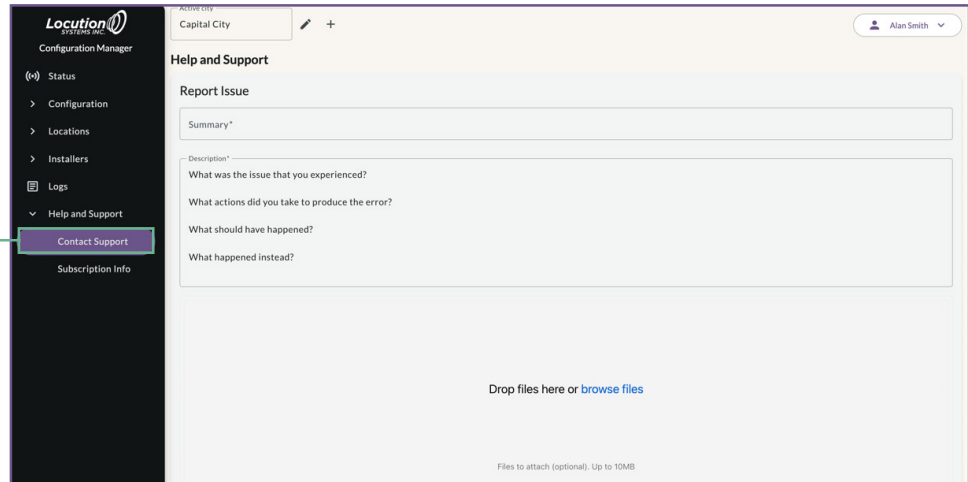

The **Radio** menu under Locations (highlighted in purple on the left bar) provides an overview of the radios, including software version and status of the software. Clicking on a specific **Radio**, provides the ability to set the selected configuration and software levels, as well as upload new files or deprecate to previous versions.

# Help and Support Options

## Help and Support

- Just a click away
- Easily attach log files

## Comparison of Configuration Portal and Manager

	Configuration Portal	Configuration Manager	Description
<b>Capability Level</b>	File Level	<b>Element Level</b>	The Manager allows viewing and editing of specific element configuration settings, such as visual alert colors, tones, speed voice, etc..
<b>Do most things without Locution Expert?</b>	No	<b>Yes</b>	The Manager interface provides easy access to configuration settings that can viewed, edited, and rolled-back without requesting help from Locution support.
<b>System Validation</b>	Partial	<b>Full</b>	The Manager validation is at the configuration element level and includes voice validation, including ADB.
<b>Ease of Operation</b>	High	<b>Very High</b>	Both are designed for ease of use. The Manager is able to do more.
<b>Self-service</b>	Limited (file-based comparisons and updating)	<b>Yes</b>	Both are self-managed, but Portal is a simple file-level view, whereas Manager allows viewing and editing specific configuration element settings.
<b>Hybrid Cloud Capability for Redundant Copies</b>	Yes	Yes	Both versions include the capability for hybrid cloud support for redundant, off-site copies of the software. Note: the system does not require cloud access to operate, but can use the cloud for redundant copies.
<b>Pricing Model</b>	No charge (for Locution clients on maintenance)	SaaS (includes software maintenance as part of SaaS)	

# Locution PrimeAlert® Configuration Portal & Manager

Locution has two versions of management software available for the **PrimeAlert®** solution. The **PrimeAlert® Configuration Portal** provides an intuitive, basic file-level overview across the **PrimeAlert®** solution. Administrators can readily view the software versions at each station to spot discrepancies, providing a high-level system validation. A log history of software versions can be viewed, including the capability to roll back to a previous version. Administrators can group stations, as well as support multiple agencies with multiple users.

When upgraded to **PrimeAlert® Configuration Manager**, administrators are able to access the full capability of the software for a more complete, detailed system validation. Administrators can quickly change individual configuration settings at specific stations. In addition to the capability of rolling back full software versions, administrators can also roll back changes to specific feature settings. Stations settings can be readily compared to spot differences. Radio settings can also be viewed and compared.

**PrimeAlert® Configuration Manager** puts the power of Locution where it should be, in the hands of the customer's system administrator. It is available from Locution on a subscription basis.

Lastly, both versions offer hybrid cloud capability to have copies of the software and configurations stored remotely. Note that the system does not require cloud connectivity to operate. Rather, the cloud can be used to provide a redundant backup copy of the software and configurations. Modern best practices for mission critical systems include having redundant offsite copies, while not requiring cloud connectivity to operate.

Please feel free to contact us at 303-301-7300 for details on specific features, pricing, and/or to schedule a demo.
